

About 1 minute. Thank the panel. Set the frame: this presentation is structured against the eight ECDF parameters, one parameter per slide, with Thinks and Delivers evidenced at Level 4 and the remaining six at Level 3, in line with the 2026/27 nomination baseline. I will keep to roughly 45 minutes so there is time for questions and deep dives.

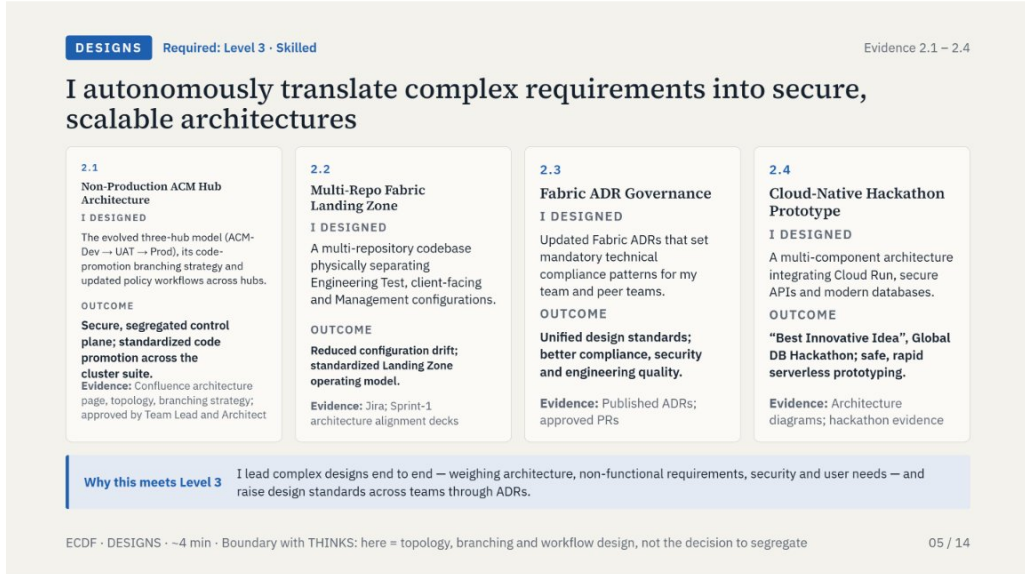

About 2 minutes. The 2026/27 nomination baseline is Level 4 (Expert) for Thinks and Delivers, and Level 3 (Skilled) for Designs, Controls, Operates, Achieves, Engages and Influences. I am not claiming the full Lead Engineer Level 4 profile across all eight; my case is Level 4 in the two critical dimensions and solid Level 3 breadth across the other six. Walk the panel through the order: the slides follow this grid left to right, top to bottom. Emphasise the discipline: every achievement appears under one parameter only, and where two achievements are related I will state the boundary explicitly.

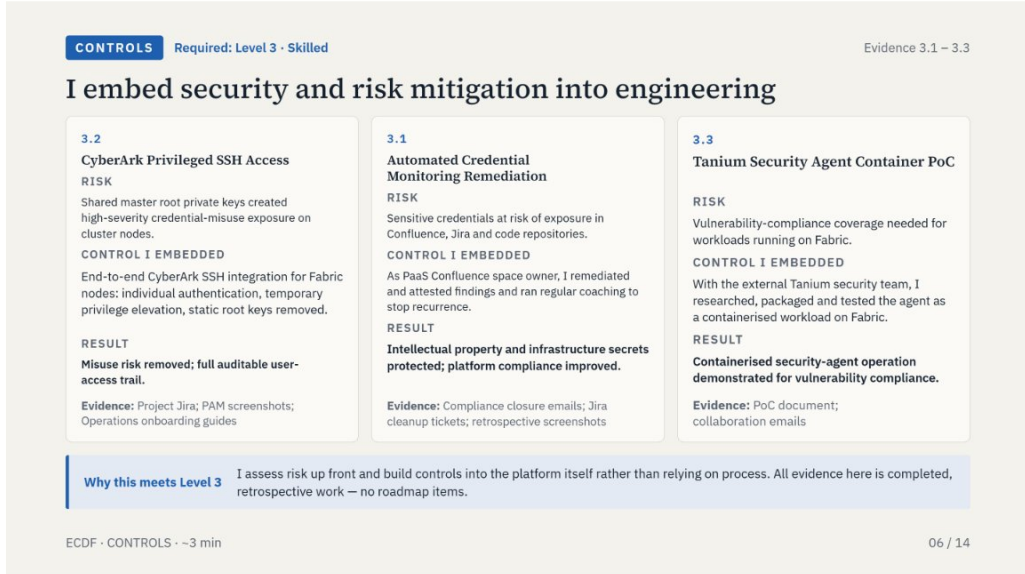

About 2 minutes. This is the story of the whole presentation. As an AVP I solve difficult problems well. What has changed is the scope and nature of the work: I now identify systemic risks before they become incidents, challenge long-standing assumptions, personally remove the hardest technical blockers, connect the engineering to business outcomes, build repeatable capabilities that do not depend on me, and influence beyond my own team. Tell the panel that each following slide is one ECDF parameter, and that for every example I will be clear about what the team did versus what I personally did.

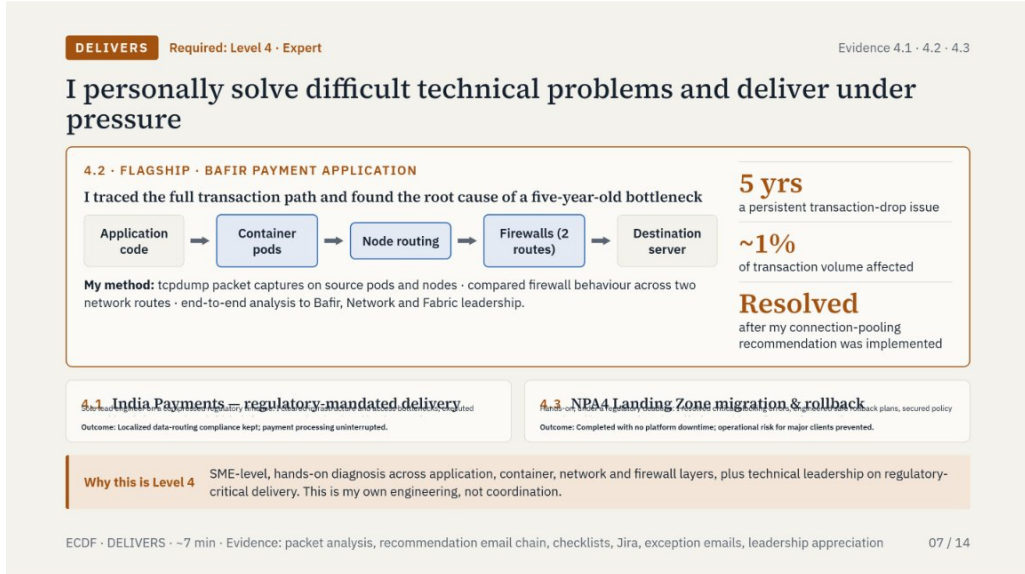

About 6 minutes. Strongest Level 4 slide alongside Delivers. 1.1 ACM segregation: the organization had one ACM Hub controlling Dev, UAT and Prod. I recognised that this put production stability for all 36 Fabric clusters at the mercy of non-production change. I challenged the assumption that a single shared control plane was good enough, initiated the segregation, designed and deployed separate ACM-Dev and ACM-UAT hubs, proved it with a PoC in Engineering Test, communicated the strategy and results to Business, Product, Operations, Customer Success and Architecture, and led the end-to-end pilot cluster migration. Evidence: Jira, strategy presentation, stakeholder emails, CR details, Confluence pilot migration documentation. Boundary: here I am presenting the strategic decision; the technical topology and branching design is evidence under Designs. 1.2 Policy reconcile: 400+ active policies; I audited, reviewed and remediated 70+ non-compliant or unused policies on ACM-Prod, removed unused and disabled ones, moved locally managed policies to the ArgoCD GitOps workflow so the drift could not return, consolidated Trident storage policies and cleaned cluster-specific project configuration. Close on why this is Level 4: multiple disparate perspectives, a long-term sustainable model, root causes addressed, divisional impact.

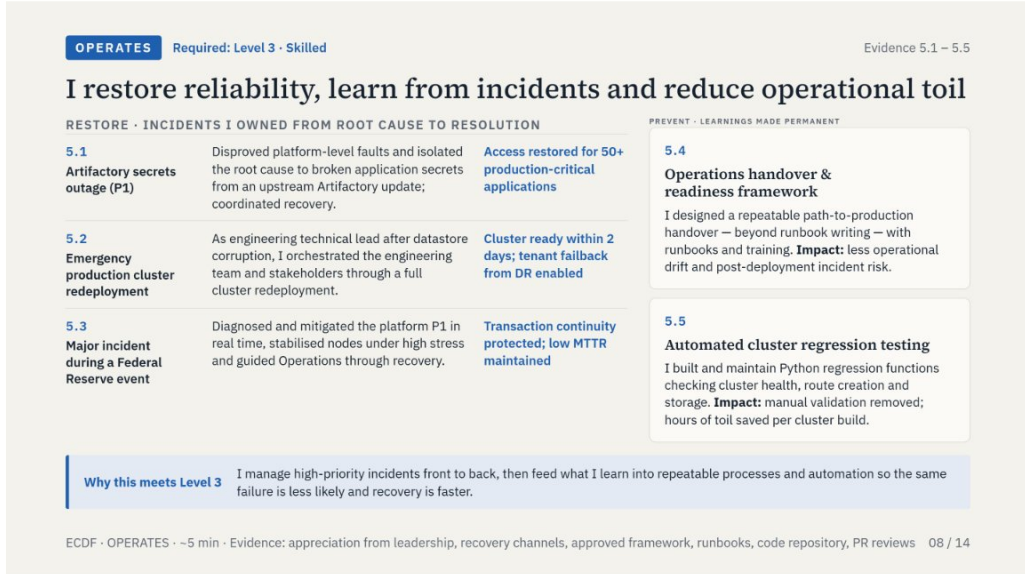

About 4 minutes. 2.1: be explicit that this is not the segregation decision (that was Thinks). Here I am showing the technical design: the new evolved ACM model covering ACM-Dev, ACM-UAT and ACM-Prod, the code-promotion branching strategy and the updated policy implementation workflow across the hub clusters, which I presented to my Team Lead and the Architect for approval. 2.2: I designed the multi-repository setup for the Fabric Landing Zone that physically separates Engineering Test, client-facing and Management configuration, securing core configuration from accidental drift; I presented it to Business, Product, Operations, Customer Success and Architecture. 2.3: I updated the Fabric ADRs and established mandatory compliance patterns used by my team and peer teams. 2.4: I designed and integrated the multi-component architecture for the Global DB Hackathon prototype, which won Best Innovative Idea. Level 3 point: autonomous lead in design, considering NFRs and security, and driving design practice across the team.

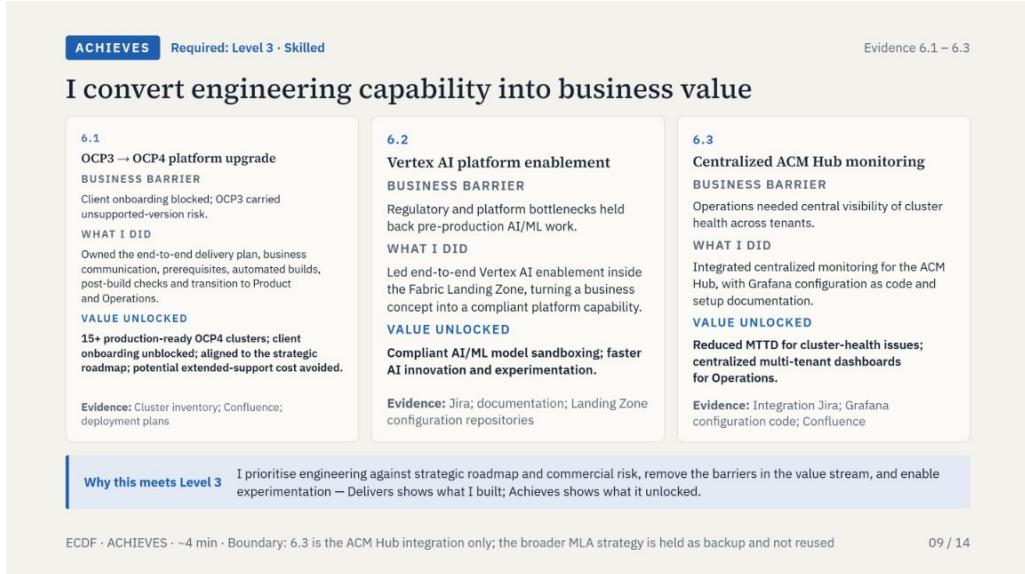

About 3 minutes. Lead with CyberArk as the strongest control. Before: operators used shared master root private keys to reach Fabric cluster nodes, a high-severity misuse risk with no individual accountability. I deployed the end-to-end CyberArk SSH integration with individual authentication and temporary privilege elevation, removed static root private-key usage, and produced Operations onboarding guides. Result: risk removed, auditable access trail. 3.1: clarify that ACM here means Automated Credential Monitoring, not Advanced Cluster Management. As PaaS Confluence space owner I managed, remediated and attested the findings and ran coaching sessions so credentials stop entering Confluence, Jira or repositories. 3.3: completed PoC with the external Tanium team, containerising their vulnerability-compliance agent on Fabric. If asked about automation plans, keep the answer retrospective; the panel assesses what has been done.

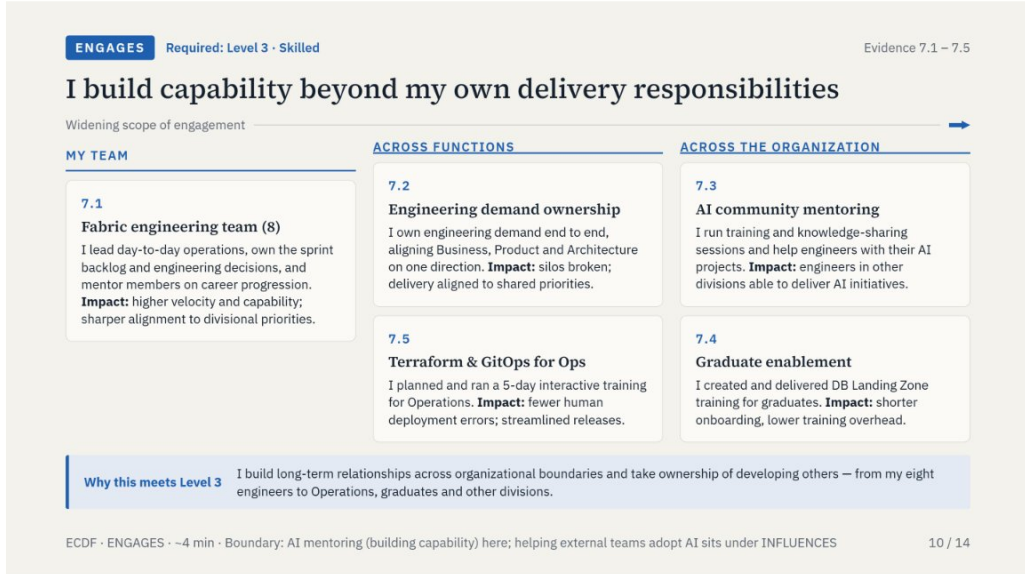

About 7 minutes. Spend most of the time on Bafir. The issue: transactions dropping on the Bafir payment application, persisting for about five years and affecting roughly 1% of transaction volume. What I personally did: investigated the complete path from application code to container pods, node routing, firewalls and the destination server; ran packet captures and tcpdump on the source pods and nodes; evaluated different firewall behaviour across the two network routes; wrote up the end-to-end analysis and submitted it to Bafir, Network and Fabric leadership; recommended application connection pooling. After implementation the issue was resolved, protecting critical client transaction pipelines and restoring payment-processing velocity. Evidence: packet analysis, recommendation email chain, meeting invites, appreciation from Fabric and Network leadership. Then briefly: 4.1 India Payments, where I was sole lead engineer under a compressed regulatory timeline across Dev, UAT and Prod; and 4.3 NPA4, hands-on migration with rollback plans and security policy exceptions obtained with CPT SRE and Security, delivered on time with no downtime. Land the Level 4 message: technical SME, personal hands-on contribution, delivery leadership on organization-critical work.

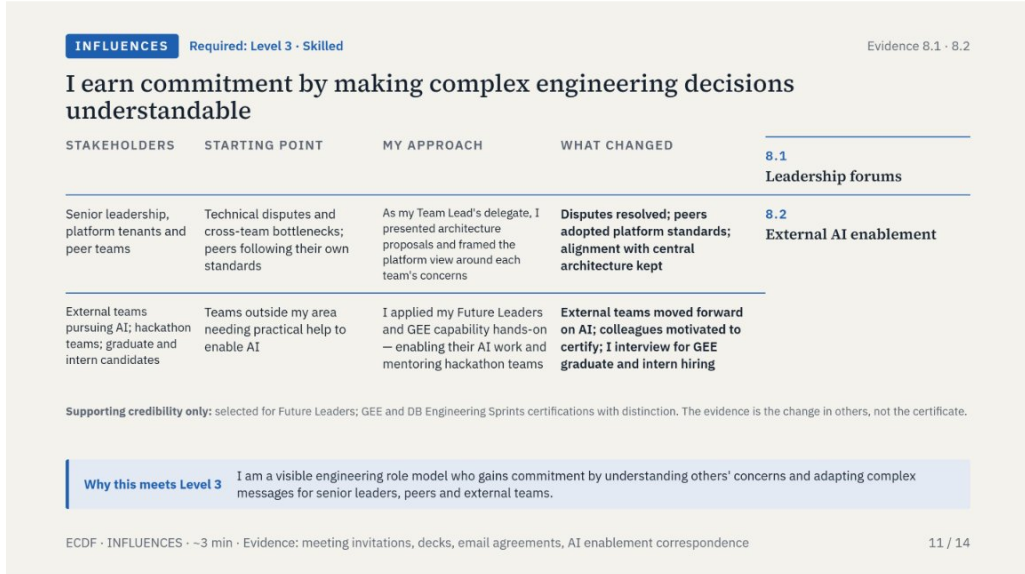

About 5 minutes. Structure: restore, then prevent. 5.1: during the secret-management failure I ruled out the platform, isolated the root cause to application secrets broken by an upstream Artifactory update and coordinated recovery for 50+ production-critical applications. 5.2: after datastore corruption I was engineering technical lead for the full cluster redeployment, orchestrating the team and stakeholders; the cluster was ready for tenant workloads within 2 days, enabling failback from DR. 5.3: during a high-visibility, high-market-volume Federal Reserve announcement I diagnosed and mitigated the platform P1 in real time, stabilised nodes and guided Operations through recovery with low MTTR. Then the VP-level point: I did not stop at fixing incidents. I designed a standardised operations handover and readiness framework, a deliberate path to production rather than just writing runbooks, and I built the Python regression automation that removes manual validation from every cluster build.

About 4 minutes. For each, answer the question: what business capability was unlocked? 6.1: client onboarding was blocked and OCP3 carried unsupported-version risk. I owned the end-to-end delivery plan, business communication, prerequisite management, automated cluster builds, post-build checks and transition to Product and Operations. Value: 15+ production-ready OCP4 clusters, onboarding unblocked, alignment to the strategic technology roadmap and potential extended-support cost avoided (say 'potential'; do not quantify). 6.2: I led Vertex AI enablement in the Fabric Landing Zone, converting a business idea into a compliant platform capability for pre-production AI/ML sandboxing. 6.3: the centralised ACM Hub monitoring integration gave Operations multi-tenant dashboards and reduced MTTD. If the panel sees 6.3 as overlapping with the broader MLA work, offer it as backup instead and do not use MLA here.

About 4 minutes. Walk left to right as widening scope. 7.1: I lead the day-to-day operations of an 8-member team, manage the sprint backlog and workload, make the engineering decisions and support career progression; evidence is sprint reports, backlog and career plans. 7.2: I own engineering demand, working with Business, Product and Architecture so platform delivery follows one cohesive direction. 7.5: I planned and delivered a 5-day interactive Terraform and GitOps training for Operations, which improved Engineering–Operations collaboration and reduced human deployment errors; evidence includes the syllabus, attendee list and feedback. 7.3: I am an active mentor in the internal AI community, running sessions and helping engineers in other divisions with their AI projects. 7.4: I created and delivered DB Landing Zone training for graduates, shortening onboarding. State the boundary: mentoring is capability-building and sits here; enabling external teams to adopt AI is about changing what they do, and I evidence that under Influences.

INFLUENCES Required: Level 3 · Skilled

Evidence 8.1 · 8.2

I earn commitment by making complex engineering decisions understandable

STAKEHOLDERS	STARTING POINT	MY APPROACH	WHAT CHANGED
Senior leadership, platform tenants and peer teams	Technical disputes and cross-team bottlenecks; peers following their own standards	As my Team Lead's delegate, I presented architecture proposals and framed the platform view around each team's concerns	**Disputes resolved; peers adopted platform standards; alignment with central architecture kept**
External teams pursuing AI; hackathon teams; graduate and intern candidates	Teams outside my area needing practical help to enable AI	I applied my Future Leaders and GEE capability hands-on — enabling their AI work and mentoring hackathon teams	**External teams moved forward on AI; colleagues motivated to certify; I interview for GEE graduate and intern hiring**

8.1 Leadership forums

8.2 External AI enablement

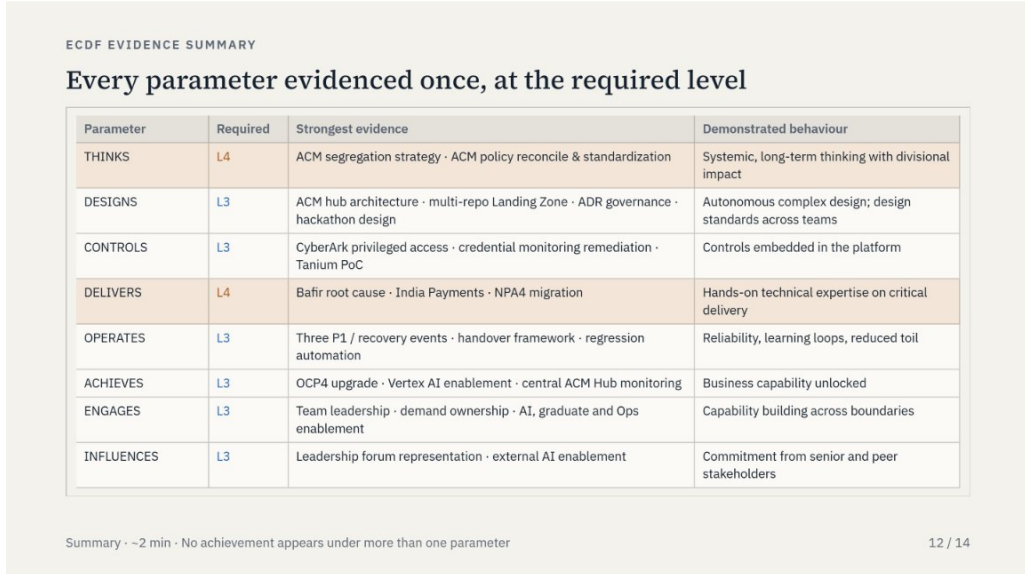

Supporting credibility only: selected for Future Leaders; GEE and DB Engineering Sprints certifications with distinction. The evidence is the change in others, not the certificate.

Why this meets Level 3 I am a visible engineering role model who gains commitment by understanding others' concerns and adapting complex messages for senior leaders, peers and external teams.

ECDF · INFLUENCES · ~3 min · Evidence: meeting invitations, decks, email agreements, AI enablement correspondence

11 / 14

About 3 minutes. Tell each as a short story: stakeholder, their starting position, my approach, what changed. 8.1: as my Team Lead's delegate in senior leadership discussions I presented architecture proposals, resolved cross-team engineering bottlenecks and technical disputes between platform tenants and peer teams, and influenced peers to adopt platform standards; evidence is meeting invitations, decks and email agreements. Prepare one specific example with names removed: [insert the dispute, the other team's concern, how I reframed it, and the agreement reached]. 8.2: the influence is in helping external teams with AI enablement; the certifications are background credibility. I also mentor hackathon teams, act as a GEE interviewer for graduate and intern hiring, and have motivated colleagues to pursue certifications. Avoid leading with awards.

ECDF EVIDENCE SUMMARY

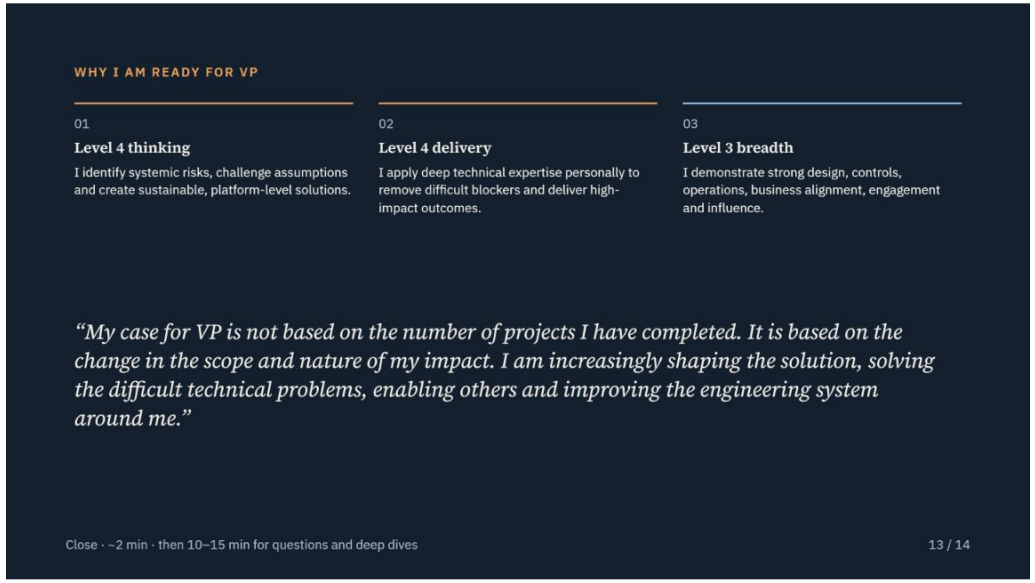

Every parameter evidenced once, at the required level

Parameter	Required	Strongest evidence	Demonstrated behaviour
THINKS	L4	ACM segregation strategy · ACM policy reconcile & standardization	Systemic, long-term thinking with divisional impact
DESIGNS	L3	ACM hub architecture · multi-repo Landing Zone · ADR governance · hackathon design	Autonomous complex design; design standards across teams
CONTROLS	L3	CyberArk privileged access · credential monitoring remediation · Tanium PoC	Controls embedded in the platform
DELIVERS	L4	Bafir root cause · India Payments · NPA4 migration	Hands-on technical expertise on critical delivery
OPERATES	L3	Three P1 / recovery events · handover framework · regression automation	Reliability, learning loops, reduced toil
ACHIEVES	L3	OCP4 upgrade · Vertex AI enablement · central ACM Hub monitoring	Business capability unlocked
ENGAGES	L3	Team leadership · demand ownership · AI, graduate and Ops enablement	Capability building across boundaries
INFLUENCES	L3	Leadership forum representation · external AI enablement	Commitment from senior and peer stakeholders

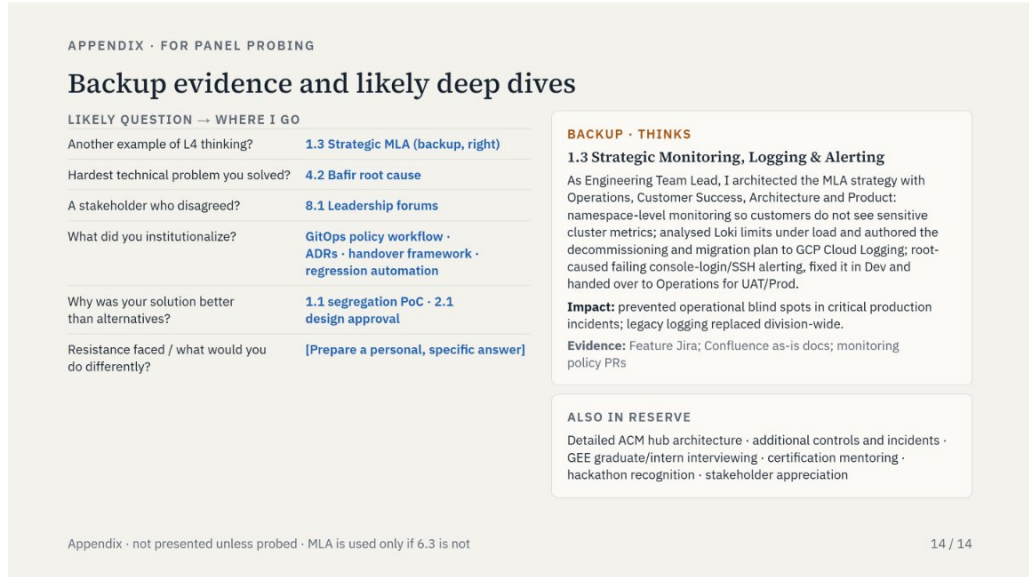

Summary · ~2 min · No achievement appears under more than one parameter

12 / 14

About 2 minutes. Do not re-tell the stories. Read the two amber Level 4 rows first: Thinks and Delivers are where I am demonstrating Expert behaviour. Then sweep the six Level 3 rows to show breadth. Reinforce that each achievement appears once only, and that I have additional evidence in reserve for any parameter the panel wants to probe.

About 2 minutes. Slow down. Three pillars: Level 4 thinking, Level 4 delivery, Level 3 breadth. Then deliver the closing statement verbatim and stop. Invite questions. Target: finish slides at around 45 minutes, leaving 10 to 15 minutes for the panel.

Not presented in the main flow. Use only when the panel asks for another example. MLA (1.3) is held back so it is never double-counted with 6.3; if the panel treats 6.3 and MLA as the same achievement, present MLA here as the additional Thinks example and drop 6.3. Before the interview, prepare personal answers for 'what resistance did you face' and 'what would you do differently'; these must be genuine and specific.
